No cloud, no GPUs, no problem: Liquid AI's new model LFM2.5-2.6B brings powerful AI agents to devices as small as a Raspberry Pi

VentureBeat – AI · Topic: **AI/Cloud/Quantum**

- **What it is:** Liquid AI's LFM2.5-2.6B is a new open-weight language model optimized for running powerful AI agents on local devices without cloud or GPU reliance.
- **Who:** Liquid AI, an AI startup founded in 2023 by former MIT computer scientists, developed this innovative edge AI model.
- **What it does:** It enables high-volume, well-defined agentic tasks like tool calling, document management, and workflow automation to run directly on diverse hardware, from smartphones to Raspberry Pis.
- **Why it matters:** This model offers enterprises significant advantages in privacy, reduced inference costs, lower latency, and expanded deployment options for regulated industries and connectivity-limited environments.
- **Strategic view:** This innovation democratizes powerful AI at the edge, unlocking new TMT service models, driving hardware innovation, and creating competitive pressure on cloud-centric AI providers with on-device capabilities.

The browser is where attacks land. Why is security still focused on the endpoint?

VentureBeat – AI · Topic: **AI/Cloud/Quantum**

- **What it is:** Browser isolation technology, exemplified by CloudMosa's Puffin Cloud Security, shifts web execution to isolated cloud environments, mitigating the increasing risk of browser-based cyberattacks.
- **Who:** CloudMosa, led by CEO Shioupyn Shen, provides Puffin Cloud Security to enterprise organizations grappling with escalating browser-based cyberattacks, often powered by AI-driven adversaries.
- **What it does:** Puffin Cloud Security executes web sessions, including all active code, within isolated cloud environments and streams only a safe pixel view to user devices, thereby preventing local code execution.
- **Why it matters:** This matters because traditional endpoint security fails as the browser becomes the primary enterprise operating environment, demanding a shift from detection to preventing malicious code from reaching devices at all.
- **Strategic view:** TMT executives must strategically pivot security investments towards browser isolation technologies to proactively mitigate AI-driven threats and protect critical enterprise workloads, making existing security infrastructure more complete.

AI agents are part of your team now. Here's how to secure all of them.

VentureBeat – AI · Topic: **AI/Cloud/Quantum**

- **What it is:** The article highlights the critical, unaddressed security challenge of AI agents operating as an ungoverned workforce within organizational systems, often without formal identity or accountability processes.
- **Who:** Organizations, particularly C-level executives and IT leaders in Telco, Media, and Tech, are directly impacted by the proliferation of AI agents that now outnumber human users in critical business functions.
- **What it does:** It introduces a four-stage framework—Discover, Register, Manage Access, and Govern Continuously—to integrate AI agents formally into identity and access management for comprehensive security and control.
- **Why it matters:** Failure to establish robust governance for AI agents exposes organizations to severe security vulnerabilities, compliance risks, and operational inefficiencies, impeding safe and scalable AI adoption.
- **Strategic view:** C-level executives must prioritize integrating AI agent governance into a unified 'Agentic IAM' strategy to securely scale AI across TMT operations, mitigating risks and ensuring compliance while protecting vital assets.
