## 3 deep-dives you should really read

### How is your enterprise tracking AI agent telemetry? Groundcover thinks it should never leave your cloud

VentureBeat – AI · Topic: **AI/Cloud/Quantum**

- **What it is:** Groundcover is an observability startup that secured \$100 million in funding to offer a bring-your-own-cloud solution for tracking AI agent telemetry within an enterprise's own infrastructure.
- **Who:** Observability startup groundcover, backed by investor One Peak, challenges market leaders like Datadog and Dynatrace by offering its unique solution to enterprises managing AI systems.
- **What it does:** Groundcover provides AI agent observability by leveraging a BYOC architecture, allowing enterprises to retain all telemetry data within their own cloud and pay based on hosts, not data volume.
- **Why it matters:** This matters because exploding AI-generated telemetry strains traditional observability pricing models, making groundcover's BYOC approach crucial for enterprises needing predictable costs and complete operational context.
- **Strategic view:** TMT C-levels must recognize the strategic shift towards BYOC observability and host-based pricing, as it fundamentally alters data ownership, cost predictability, and vendor relationships in the burgeoning AI agent economy.

### Structured AI data pipelines score 10.9 points below free-form code — DataFlow-Harness closes the gap

VentureBeat – AI · Topic: **AI/Cloud/Quantum**

- **What it is:** DataFlow-Harness is a new open-source framework developed by academic researchers to address the limitations of LLMs in creating production-ready data pipelines.
- **Who:** Researchers from Peking University, Zhongguancun Academy, and Shanghai's Institute for Advanced Algorithms Research developed DataFlow-Harness.
- **What it does:** It guides large language models to construct structured, visual, and governable data-processing pipelines using platform-specific components, rather than generating free-form code.
- **Why it matters:** This innovation closes the 'NL2Pipeline gap,' making AI-generated pipelines auditable, persistent, and production-ready, while significantly reducing API costs and response latency.
- **Strategic view:** This enables TMT organizations to accelerate the secure, cost-effective, and scalable deployment of complex AI applications by bridging the critical gap between LLM capabilities and enterprise MLOps needs.

### The Download: Montana's new experimental drug rules

MIT Technology Review – Tech · Topic: **AI/Cloud/Quantum**

- **What it is:** Montana has advanced new legislation allowing biotech companies to offer experimental drugs to patients earlier in their development process after minimal preliminary testing.
- **Who:** Montana's state government, in collaboration with biotech companies, is implementing a new regulatory framework impacting drug development and patient access.
- **What it does:** This legislation accelerates the availability of investigational medical treatments by significantly lowering the prior testing requirements for pharmaceutical companies.
- **Why it matters:** It could establish Montana as a critical early-stage drug trial hub, potentially attracting significant biotech investment and fostering rapid medical innovation.
- **Strategic view:** This trend towards localized, accelerated medical innovation mandates TMT sectors consider evolving data infrastructure, privacy, and digital health platform needs.
