Architectural patterns for graph-enhanced RAG: Moving beyond vector search in production

VentureBeat – AI · Topic: **AI/Cloud/Quantum**

- **What it is:** Graph-enhanced RAG combines semantic vector search with structural graph databases to provide Large Language Models with both meaning and explicit relationships from private data.
- **Who:** This architecture is primarily for enterprises in regulated domains like finance, supply chain, and healthcare that deal with highly interconnected and complex data.
- **What it does:** It allows LLMs to perform accurate multi-hop reasoning by understanding explicit data relationships, preventing hallucinations that occur with vector-only retrieval in complex enterprise scenarios.
- **Why it matters:** Traditional vector search often fails to capture crucial structural context, leading to inaccurate AI responses for critical business questions that depend on interconnected data.
- **Strategic view:** C-levels should evaluate graph-enhanced RAG for domains requiring explainability and precise multi-hop reasoning, balancing its latency and consistency complexities against the need for structural data truth.
